

Smart Blind Cane

Blynk Iot APP

- Blynk is an Internet of Things (IoT) platform used to control and monitor devices remotely using a smartphone.
- It connects hardware like Arduino, ESP8266, or ESP32 to a mobile application through the internet.
- In the Smart Blind Cane project, Blynk displays sensor data and sends alerts such as obstacle warnings, dark area alerts, and emergency notifications with location.

Types of Alerts

1. **Obstacle Danger Alert** – When the ultrasonic sensor detects an object very close (for example 3.79 cm or 5.08 cm), the system sends an 'Obstacle Danger' alert to warn the user.
2. **Dark Area Alert** – When the LDR sensor detects low light (values like 393 or 409), the system sends a 'Dark Area Danger' alert indicating poor visibility.
3. **Emergency Alert with Location** – The system sends an emergency notification with distance, LDR value, and a Google Maps location link so caregivers can check the exact location.
